Summary

This plan explains the Washington State Department of Transportation's (WSDOT) policy and practice for maintenance of roadside vegetation for Maintenance Area 4 within the agency's Northwest Region. This area manages vegetation within approximately 235 miles of state highway corridor in south King and eastern Pierce Counties. Highways in this area carry some of the highest traffic volumes in the state. Major corridors include portions of Interstates 5 and 405. Other limited access corridors include State Routes 18, 167, 518, and a portion of 509. SR 410 east of Enumclaw is referred to as the Mather Memorial Parkway and has been designated as an All American Road. A map of the area is included as **Figure 1** on the following page.

The primary objectives in maintenance of roadside vegetation within the area are in relation to safety of the highway users, preservation of the highway infrastructure, and control of legally designated noxious weeds where they occur on the right of way. Other considerations include protection and preservation of natural environment, preserving and enhancing the natural scenic quality of the roadside, and being a good neighbor to the many adjoining property owners. In all cases, roadside vegetation maintenance activities are planned and conducted in a way that discourages or eliminates unwanted vegetation and promotes desirable vegetation. This is the basic premise of Integrated Vegetation Management (IVM) and the foundation of the program.

This document and associated information management tools serve as the primary reference for maintenance of roadside vegetation in the area. Included is detailed information on locations for planned routine maintenance practices, reoccurring weed infestations, sensitive areas, and other areas with special management considerations. Also included are guidelines and prescriptions for best management practices in dealing with roadside vegetation problems and opportunities. In effect, this plan supports WSDOT's compliance with state law (RCW 17.15) by implementing the principles of Integrated Pest Management for the management of roadside vegetation. It also supports WSDOT's long-range goals for the management of roadsides to:

- Create naturally stable, sustainable plant communities
- Improve effectiveness and efficiency in the control of weeds and unwanted trees and brush
- Reduce maintenance cost and herbicide use over time

This plan is organized around the major categories of roadside vegetation maintenance work. The major categories include: Zone 1 (or pavement edge maintenance), Routine Mowing, Noxious Weed Control, Nuisance Weed Control, Tree and Brush Control, and Special Maintenance Areas.

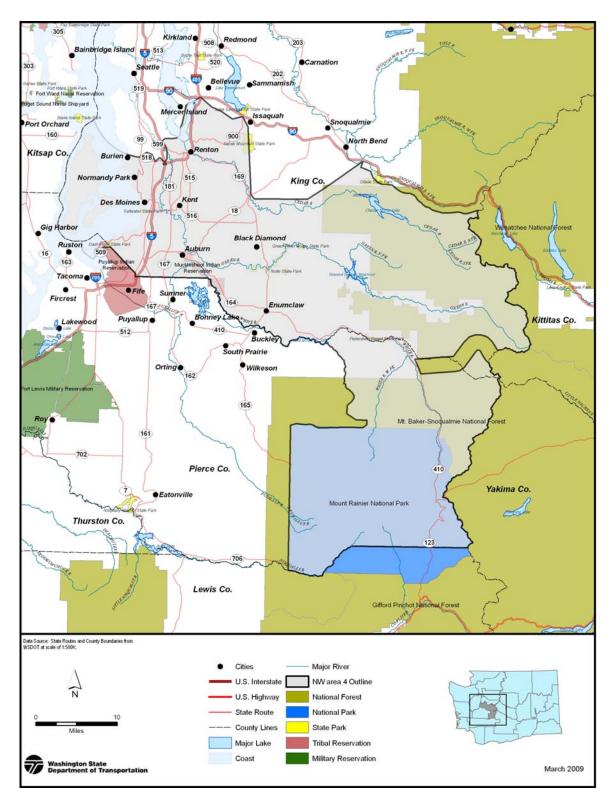

The management of roadside vegetation is a dynamic process and it is intended that this plan be continuously adapted over time based on input from a variety of sources. An integral component of the plan is a database for recording Integrated Vegetation Management (IVM) treatments for specific vegetation controls and locations, and to record information on follow up evaluation on these treatments. This information will be used to refine planned treatments over time.

WSDOT is also requesting that local public and private entities with an interest in weed control and vegetation management provide input on the plan and cooperate in efforts where appropriate. Copies of the complete draft plan are available online:

www.wsdot.wa.gov/maintenance/vegetation/mgmt_plans.htm, hard copies can also be provided upon request. Please contact Gary Ward or Ray Willard with questions or comments:

Northwest Region, Area 4 Map Figure 1

Roadside Management Considerations

The primary objectives for maintenance of roadside vegetation are to provide for safe highway operation and to comply with legal regulations for control of noxious weeds and protection of the environment. Overall WSDOT maintenance policy and procedures are defined in Chapter 6 of the WSDOT Maintenance Manual (M51-01, March 2002) www.wsdot.wa.gov/fasc/EngineeringPublications/Manuals/MaintenanceManual.pdf

Visual Quality

It is also important to maintain appropriate visual standards in the appearance of the roadside. All maintenance activities should be conducted in a way that minimizes visual impacts such as wide spread "brown-out" from herbicides or shattered limbs from side trimming. Roadsides should look as natural as possible throughout the year. Appropriate visual quality for roadsides throughout the state is defined in the <u>WSDOT Roadside Classification Plan</u> (June 1996) www.wsdot.wa.gov/fasc/EngineeringPublications/Manuals/RCP.pdf

Operational Zones

WSDOT roadsides are divided into several zones for the purposes of assigning management objectives, maintenance needs, and thresholds for triggering vegetation maintenance actions. Noxious weed species designated for control by state and county law are controlled throughout all zones. Not all management zones occur along all state highways. In some cases the narrow width of the right-of-way or adjoining land-use, limits the operational zones to Zone 1 and/or a narrow Zone 2 only. Roadside vegetation management zones are illustrated in **Figure 2** below and defined as follows:

Zone 1 – A vegetation free gravel shoulder, where needed, is maintained as a one to three-foot wide strip to provide for key maintenance, operational, safety, and pavement and guardrail preservation needs.

Zone 2 – The operational zone extends from the edge of Zone 1 or the pavement edge to a width necessary to provide for safe errant vehicular recovery, maintain sight distance at corners and intersections, and provide for other operational, safety, and environmental functions.

Zone 3 – In areas with sufficient right-of-way width, a buffer or transition zone extends from Zone 2 to the right-of-way line or across the median to provide a buffer or transitional area between the highway facility and adjacent land uses. This area is maintained selectively, and to the greatest degree possible as a self-sustaining plant community, to minimize erosion as well as the growth of weeds and undesirable trees and brush. In some urban and suburban settings, additional maintenance is required on fence lines behind Zone 3.

Roadside Maintenance Activities

All roadside maintenance activities are to be planned and conducted in a way that discourages or eliminates unwanted vegetation and promotes desirable vegetation. This is the basic premise of Integrated Vegetation Management. In every case it is essential that the results of maintenance activities are evaluated and adjusted as necessary to maximize efficiency and effectiveness. However, in some cases maintenance activities are conducted more consistently on an annual basis, such as maintenance of Zone 1 where required, and routine mowing where specified.

Routine Maintenance Activities – When vegetation maintenance activities are intended to keep the area of roadside being treated in an annually controlled condition, they are considered routine. This is more critical for areas of vegetated roadside near the travel lanes, edge of pavement, and around guardrails. This plan provides prescriptions and gives locations for routine maintenance activities including maintenance of Zone 1 and annual mowing.

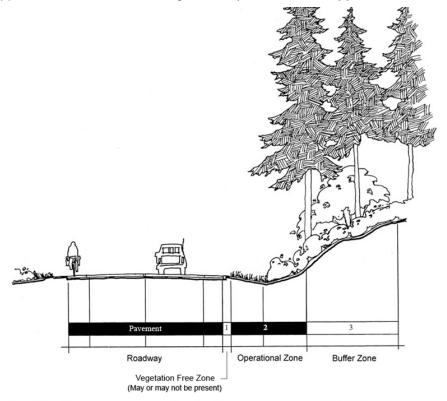

Integrated Vegetation Management Activities – Although all activities are to be planned and conducted in accordance with the principles of IVM, many vegetation

maintenance activities are intended to target a specific type or types of unwanted plants. By carefully planning and carrying out these target specific activities it is possible over time to establish desirable vegetation, which will prevent the re-infestation of unwanted plants. The process for determining and carrying out IVM actions is illustrated in **Figure 3** below. This plan provides information, locations, and gives prescriptions for selective control of weeds and other unwanted vegetation and the promotion and establishment of desirable vegetation. Further information and guidance on the application of IVM is available in the document Integrated Vegetation Management for Roadsides (WSDOT, July 1997) www.wsdot.wa.gov/maintenance/pdf/IVM.pdf

Special Maintenance Areas – In some locations there are unique situations that require consideration in determining appropriate vegetation maintenance actions. Examples of these are: environmentally sensitive areas, areas with special neighbor concerns, areas where a higher level of maintenance is expected such as gateway interchanges or formally landscaped areas, or along highways that cross tribal or federal lands. This plan provides information and guidance on the locations and unique requirements or restrictions on maintenance activities in all of these situations throughout the area.

Herbicide Use

WSDOT has conducted independent research on herbicide risk from toxicity and environmental fate, based specifically on agency application methods and use rates. Findings from this research have been used to establish an approved palette of herbicides and application limits for state highways. A complete summary of herbicides approved for use on WSDOT rights of way is included in **Appendix B**.

Vegetation Free Zone Gravel Shoulder Maintained in designated locations using mechanical and chemical methods for sight distance, to improve

drainage, and to preserve pavement

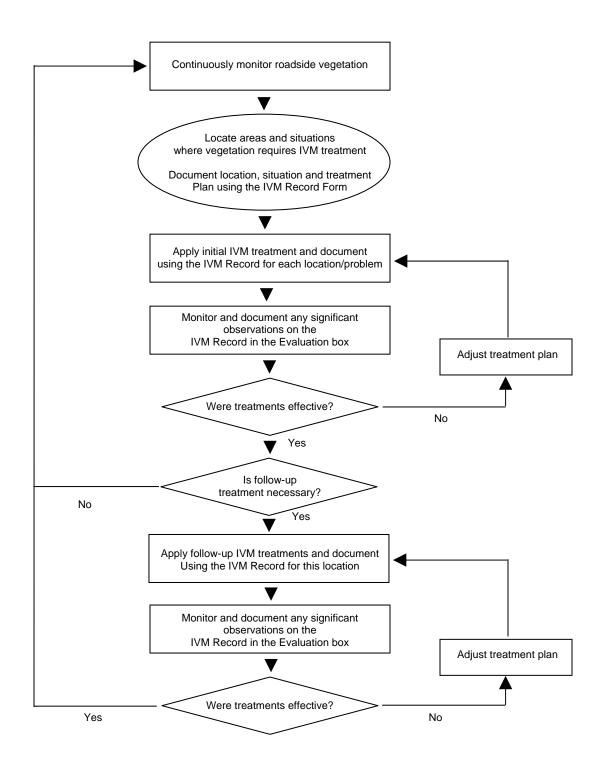

and roadside hardware

Operational Zone
Low Vegetation
Maintained with mowing and IVM
treatments for sight distance, safe
errant vehicle recovery, and weed
control.

Buffer Zone Native/ Natural Vegetation Where adequate right of way exists, maintained using IVM to encourage desirable vegetation in selfsustaining plant communities.

Typical Roadside Vegetation Management Zones

Figure 2

The IVM Decision-Making Process

Figure 3

The purpose of this section is to identify the highest priority roadside vegetation management needs in NW Region, Area 4. Priorities are listed by specific activities and locations in relation to the three major groups for roadside vegetation maintenance performance: Control of Vegetative Obstructions, Noxious Weed Control, and Nuisance Weed Control. This section is intended to supplement the information in the following section, *Northwest Region, Area 4 – Roadside Vegetation Management Plan* which details the guidelines and methods for accomplishing the work of roadside vegetation management. The following lists essentially describe work plans for NW Region, Area 4 crews in 2009 and the following two to three years.

Control of Vegetative Obstructions

Since the work of this group of maintenance activities relates to the safety and operation of the highway, these items are considered first priority in terms of the overall roadside maintenance priority. Activities and locations of greatest need include:

- I-5 HOV By-pass ramps at 405 interchange cleared of brush for sight distance
- I-5 NB S 200th to 405 interchange control alder trees in median ditch line and side slope
- SR167 cut back willow trees from guardrail and shoulder SB 43rd to S 212th SB 277th to 37th
- SR900 selectively trim encroaching brush and side branches, remove lowhanging overhead branches
- SR 164, MP 4.7 to 13.5 EB/WB, mow 1 pass 1 time, mow out further as needed at intersections.
- SR 410, MP 22.1 to 23.4 and MP 27.9 to 57.7 EB/WB, mow 1 pass 1 time beginning mid-June.
- SR169, MP 14.3 to 19.2, 9.1 to 10.2 and 1.1 to 6.9 NB/SB, mow 1 pass 1 time beginning mid-June.
- SR 515, MP 2.3 to 4.2 NB/SB, mow 1 pass 1 time beginning mid-June.
- SR 516, MP 12.4 to 14.4 EB/WB, mow 1 pass 1 time beginning mid-June.
- Continue removing encroaching side branches from conifers on SR 410 from MP 46 to 28 EB/WB in August and till October as time allows.

Noxious Weed Control

Noxious weeds are those species legally designated by state and county regulations for required control by all property owners. Because laws provide for fines and/or control work and billing of property owners by county administration, work under this group is considered second priority after critical safety related locations have been addressed. Species and locations are negotiated with the county weed boards on an annual basis and for 2009 include:

- I-5 Control Butterfly bush in median S188th to S144th using cutting and selective chemical application
- SR167 Continue to monitor and control policeman's Helmet in Mill Creek area around SR 18 interchange by hand pulling
- SR509 Continue to monitor location for previously controlled infestation of policemen's helmet near Des Moines Way the in vicinity of S. 168th St. and Miller Creek.

Nuisance Vegetation Control

Nuisance vegetation control includes control/management of weed species that are recommended but not mandated, by state and county law. It also includes work such as mowing of grass and weeds in areas where a more neatly maintained appearance is desired such as in gateway interchanges or highways in urbanized areas. Because nuisance vegetation control is lower priority after safety related and legally mandated activities, the location and work actions listed below may be postponed depending on availability of resources.

- I-5, control blackberries, brush and lower tree limbs by mowing and cutting in S320th and SR 516 interchanges for gateway / visibility impacts
- SR 509, control scotch broom in S. 160th I/C quadrants
- SR 518, Control blackberries in planting beds and scotch broom in SR 99 I/C quadrants and entrance to SeaTac Airport.
- SR 516 MP 2.3 to 3.3, control scotch broom and blackberry to enhance this section as a gateway into Kent.
- SR410, MP 27.4 to MP 27.9, mow all right of way for appearance of parking for horse trail riding.
- SR 410 at view point on and continue east on SR 410 to MP 57.7, continue spraying and removing or mowing Scotch broom.

1. ROUTINE MAINTENANCE ACTIVITIES

Roadside maintenance activities are considered routine when regular annual treatment is required to keep vegetative growth from interfering with highway operational and maintenance objectives. Typical routine maintenance activities are maintenance of Zone 1 and certain types of mowing and trimming.

1.1. Routine Pavement Edge Maintenance (Zone 1)

WSDOT is currently re-evaluating its policy for maintenance of Zone 1. Past policy and practice will be refined over the coming years in response to findings from study of long-term benefit/cost resulting from alternative treatments. For the 2006 growing season, vegetation at the edge of pavement will be managed as follows on roadsides in this maintenance area:

1.1.1. Guidelines

- Zone 1 is maintained only under and around guardrail in NW Region, Area 4
- Zone 1 under guardrail is maintained at 3' width or less.

1.1.2 Methods

- Zone 1 under guardrail is maintained with an annual application of non-selective post-emergent and soil residual pre-emergent herbicides in May.
- All shoulders will be monitored for edge build-up and low spots where storm water ponds on shoulder will be selectively graded as needed.
- See Appendix A, Routine Maintenance Prescriptions, Zone 1
 Maintenance

1.1.3 Locations

Areas for Zone 1 maintenance under guardrail are shown in Appendix
 C, Zone 1 Map

1.2. Routine Mowing/Trimming (Zone 2)

1.2.1. Guidelines

- Routine annual mowing only occurs on limited access highways and in designated areas along secondary highways adjacent to edge of pavement in Zone 2, and beyond Zone 2 in designated focus areas such as interchanges, intersections and urban segments. In all other areas mowing is only used occasionally as part of IVM treatments for weed and brush control as described below in **Section 2**.
- Routine annual mowing occurs on all secondary roads in NW Region, Area 4. Routine mowing on secondary roads extends one pass along the edge of pavement, except where additional width is required for site distance on curves or at intersections. Mowing in these locations is conducted at least once per year.

1.2.2. Methods

- On limited access corridors, routine annual mowing areas are designated as either single pass or multiple pass.
- Single pass mowing consists of one pass up to the maximum width of mowing equipment, which typically extends 6' to 8' from the edge of pavement.

- In areas designated as multiple pass mowing on limited access highways, roadsides are mowed out from edge of pavement to the right of way line, the edge of shrub or tree lines, or across the entire median widths depending on the location and the presence of desirable vegetation.
- See Appendix A, Routine Maintenance Prescriptions, Zone 2
 Maintenance

1.2.3. Locations

 Single pass routine mowing occurs on all roadsides in the area, except for inaccessible steep slopes behind Jersey barrier or guardrail.
 Appendix D, Routine Mowing Map shows locations on limited access highways where routine annual mowing occurs as multiple passes.

1.3. Hazard Tree Removal

1.3.1. Guidelines

- Hazard tree removal is considered a routine maintenance activity because maintenance is constantly on the look out for any trees that pose an imminent threat to the highway or traffic, and whenever hazard trees are identified they are routinely removed as soon as possible.
- Hazard trees may be dead, leaning, or structurally unsound. Best horticultural judgment will be used in evaluating trees that appear diseased or structurally unsound or are believed to pose a long-term threat to determine the best course of action.
- Another consideration in removal of trees is the contribution to shading in areas prone to frost and ice formation on the highway surface. When such areas are identified, the surrounding canopy may be thinned through selective removal of large trees on the right of way.

1.3.2. Methods

 Hazard trees are removed in such a manner to minimize damage and impact to the highway structure and other healthy trees and under-story vegetation.

2. INTEGRATED VEGETATION MANAGEMENT ACTIVITIES

For all vegetation management needs not addressed through routine maintenance as described above, activities are planned and carried out using the principles of Integrated Vegetation Management (IVM) and the decision making process diagrammed in **Figure 3** on page 7. IVM is a coordinated decision making process that uses the most appropriate vegetation management methods and strategy, along with a monitoring and evaluation system, to achieve long term roadside maintenance goals and objectives in an environmentally and economically sound manner. The goal in utilizing the IVM approach is the establishment of stable, low maintenance native or naturalized plant communities on the roadside that are compatible with:

- Highway maintenance and safety objectives
- Preservation of environmental quality
- Weed control requirements
- The concern's of WSDOT's customers and neighbors.

Long term, the use of the IVM approach can reduce the intensity and cost of maintenance as well as minimizing the need to use herbicides.

2.1. Integrated Vegetation Management Planning and Tracking Database

2.1.1. Guidelines

- An Integrated Vegetation Management Records database is available for use statewide. This database is accessed through the same WSDOT network application as the Pesticide Application Records database.
- Any activities focused on treatment of a specific location and species infestation, or focused on treatment of any types of unwanted vegetation throughout the area will be documented with an initial IVM record outlining the long-term treatment plan. These same records will be updated over time whenever planned treatments are carried out, or when observations are made as to the success or failure of past treatments.
- Treatment records may be printed out and inserted into Appendix
 G in the plan binder.

2.2. Noxious Weed Control

2.2.1. Guidelines

- Noxious weed control is a high priority for WSDOT because of state law requiring control of designated species. Transportation rights of way are high priority locations for control of noxious weed species within the state because they cross and link so many adjacent properties and land uses.
- Whenever possible, designated noxious weed species and infestations locations will be documented and treated following plans as defined by IVM record forms in the database.
- Washington State Law classifies noxious weeds in three classes: A, B, and C. All Class A species require eradication wherever they occur statewide. The law allows for individual county weed boards to designate individual Class B and C weeds for control within the counties depending on how widespread and potentially harmful they are at the local level.
- For the purposes of this plan, noxious weeds are defined all as Class A species and any Class B and C species selected by the counties for designated control within the counties.

 For NW Region, Area 4 the following weeds are considered mandatory for control and are known to exist on state highway rights of way in South King and Eastern Pierce Counties.

Class A

Class A noxious weeds are non-native species with a limited distribution in the state. No Class A weeds are known to exist on WSDOT rights of way in this area.

Class B

Class B weeds are more widespread than Class A, with control mandated by law only if infestations are generally limited and the species are designated within the individual counties by the County Noxious Weed Control Boards. The following Class B weeds are known to exist on state right of way and are designated for mandatory control in King and/or Pierce Counties:

Common Name/Botanical Name	King	Pierce
Policeman's helmet/Impatiens glandulifera	•	Not present
Ragwort tansy/Senecio jacobaea	•	♦
Knapweed sp./Centaurea sp.	•	♦
Purple loosestrife/Lythrum salicaria	•	♦
Wild chervil/Anthriscus sylvestris	•	♦
Sulfur cinquefoil/Potentilla recta	•	♦
Hawkweed sp./Hieracium sp.	•	♦
Dalmatian toadflax/Linaria dalmatica	•	♦
Gorse/Ulex europaeus	♦	•
Poison hemlock/Conium maculatum	Not selected	•
Common reed/Phragmites australis	•	Not present

Class C

Class C noxious weeds are widely established throughout Washington or may impact the agricultural industry. County weed boards may still designate Class C species for control if they are limited in distribution in the county and they pose a significant potential threat. There are no Class C weeds known to exist on state right of way which are designated for mandatory control in King and/or Pierce Counties.

2.2.2. Methods

- Because noxious weed species are often difficult to control, herbicides treatments are often the primary, initial means of control.
- If infestations are limited to a few plants, hand pulling is also
 effective when the entire root system is also removed. Maintenance
 employees are encouraged to be aware of and look for new noxious
 weed occurrences, and to stop and pull these plants whenever
 possible.
- In conjunction with weed control treatments, a variety of other
 measures may be taken to promote natural vegetative competition
 through seeding, planting, and soil enhancement. The IVM Record
 and database are essential to the execution and success of these
 control measures.
- For recommended treatments specific to noxious weed species, see Appendix A, IVM Prescriptions, Noxious Weed Control

2.2.3. Locations

 Appendix E, Noxious Weed Location Map shows locations where reoccurring infestations of noxious species are known to exist in NW Region, Area 4.

2.3. Nuisance Weed Control

2.3.1. Guidelines

- For the purposes of this plan, nuisance weed species are defined as species listed as Class B and C weeds on the state noxious weed lists, but not selected for mandatory for control within individual counties.
- Nuisance weed control, while not required by state law, provides many positive benefits to the overall condition of the roadside, enhances ecological function by maintaining and enhancing native plant communities, reduces the potential for continuing spread of weed infestations, and enhances visual quality.
- Nuisance weed species will be controlled when time and budget allows.
- Priority will be given to locations with the highest chance for success including relatively new infestations and where there is potential for infestations to spread to un-infested areas of the right of way or to un-infested neighboring properties.
- Species considered nuisance weeds in NW Region, Area 4 and known to exist on state rights of way include:

Common Name/Botanical Name	King	Pierce
Butterfly bush/Buddleja davidii	•	•
Poison hemlock/Conium maculatum	•	Noxious
Knotweed sp./Polygonum sp.	•	•
St. Johnswort/Hypericum perforatum	•	•
Common tansy/Tanacetum vulgare	•	•
Bull thistle/Cirsium vulgare	•	•
Canada thistle/Cirsium arvense	•	•
Scotch broom/Cytisus scoparius	•	•
Common Mullein/Verbascum thapsus	•	•
Himalayan blackberry/Rubus discolor	•	•

2.3.2. Methods

- Control measures for nuisance weed are dependent on the type of plant.
- Woody species such as Scotch broom and Himalayan blackberry are most effectively treated with a combination of cutting, herbicide treatments and encouragement of native vegetation.
- Perennial species such as Canada thistle are most effective controlled by succeeding years of properly timed herbicide applications.
- Annual or biennial species such as bull thistle and common tansy
 may also be effectively controlled with herbicide applications when
 plants are in the rosette stage in spring, or by hand pulling prior to
 seed set.
- See Appendix A, IVM Prescriptions, Nuisance Weed Control.

2.3.3. Locations

 Locations for nuisance weed control activities will be identified in the Area IVM Goals section of the plan beginning on Page 9.

2.4. Tree and Brush Control

2.4.1. Guidelines

- Trees and brush are controlled for safety reasons including preservation of sight distance at curves and intersections, and for visibility of signs, and preventing trees with large trunk diameter from growing too close to traffic lanes.
- If present, native large shrub and small tree species should be allowed to grow and mature in Zone 2 and side trimmed if they begin to encroach on site distance or other traffic operational requirements.
- Large coniferous or hardwood deciduous tree species such as
 Douglas fir, big leaf maple, alder, or cottonwood left to grow in Zone
 2 and in some cases parts of Zone 3, can reach substantial size
 over a relatively short period of time and should be removed when
 young.

2.4.2. Methods

- Removal of undesirable tree and brush species is typically accomplished by hand cutting, hand pulling, properly timed selective mowing, properly timed herbicide applications, or combinations thereof.
- In some locations it is most effective to mow or cut back the majority
 of the existing vegetation and then selectively treat undesirable regrowth with herbicides in succeeding years, allowing desirable
 vegetation to grow up around and form a competitive cover.
- In some cases when tree and brush species are cut by hand, the debris can be fed through a chipper and placed back on the roadside in the form of mulch.
- Timing of these activities has a significant effect on how the vegetation grows back. Herbicide applications made by hand, directly to the cut surfaces of undesirable plants may be used to reduce or eliminate grow back.
- Chemical control methods will not be used on conifers greater than 2 feet in height.
- Chemical control methods will not be used on deciduous tree and brush species until after the first of September, except for as stump treatments in conjunction with mechanical cutting to eliminate growback.
- Whenever possible, safe and practical, seedling trees will be dug or pulled by hand and transplanted to areas where there growth will be beneficial and appropriate. Agreements may be signed to allow private citizens to collect seedlings for use as transplants.
- See Appendix A, IVM Prescriptions, Tree and Brush Control.

3. SPECIAL MAINTENANCE AREAS

Special Maintenance Areas are any locations with unique maintenance requirements or special considerations for roadside management. These areas may include interchanges, community entrances or enhancement areas, areas maintained by cities, bicycle paths, storm water retention ponds, state park land, wellheads, environmentally sensitive areas, school zones and roadsides adjacent to individual properties with current or annual no-spray agreements.

3.1. Interchanges/Intersections

3.1.1. Guidelines

 Interchange areas are sometimes developed to a greater level than general roadside areas to include storm water management facilities, pedestrian areas, and permanent vegetation designed for screening, and visual enhancements for community entrances.

3.1.2. Locations

 Interchanges and intersections with unique maintenance considerations are listed in Appendix F, along with notes describing practices for each location.

3.2. Formally Landscaped Sections

3.2.1. Guidelines

 In some areas such as around the entrance to SeaTac airport, the roadsides have been planted with ornamental landscaping. In general, roadsides on limited access highways in urban areas are maintained to a higher level when possible.

3.2.2. Locations

Areas considered as formally landscaped are listed by route and begin
and end milepost in **Appendix F**, along with notes describing practices
for each location.

3.3. City Maintenance Areas

3.3.1. Guidelines

 In most cases where non-limited access highways exist within city limits, the roadside (all area outside the highway pavement and drainage systems) are maintained by the local city government.

3.3.2. Locations

 Areas where roadsides are maintenance by cities are listed by route and begin and end milepost in **Appendix F**.

3.4. Herbicide Sensitive Areas

3.4.1. Guidelines

- In some situations herbicide use is limited or restricted because of legal requirements, neighbor concerns, or WSDOT imposed environmental safety precautions.
- In these locations, vegetation must be managed without the use of herbicides or with only a limited palette of herbicide types.

3.4.2. Locations

 Herbicide sensitive areas and reason/type of limitations on herbicide use are listed by route and begin and end milepost in Appendix F.

3.5. Adopt-a-Highway and Neighbor Maintained Agreements

3.5.1. Guidelines

 In some locations WSDOT has signed agreements with private citizens or neighboring businesses for maintenance of roadside vegetation.

3.5.2. Locations

 Areas with existing agreements for others to maintain a portion of the roadside are listed in **Appendix F**, along with notes describing arrangements for each location.

3.6. Storm Water Management Facilities

3.6.1. Guidelines

- Storm water management facilities include bio-filtration swales, retention ponds and infiltration ponds.
- Storm water management facilities are managed for noxious and nuisance weeds following the same guidelines mentioned in previous sections. The primary objectives with regard vegetation management within these facilities are maintenance the functionality in terms of the designed volume of retention and water flow, and the maintenance of the surrounding fence
- Trees and brush should be cleared along both sides of the perimeter fencing for a width of approximately 8 feet as needed.
- Inlets and outfalls should be kept clear of vegetation and debris.

3.6.2. Locations

 Stormwater management facilities are listed by route and milepost in Appendix F.

3.7. Wetland Mitigation Sites

3.7.1. Guidelines

Wetland mitigation sites are carefully monitored through WSDOT's
 Environmental Services Office for up to 10 years following their creation
 to ensure compliance with environmental regulation. In most cases
 vegetation in these sites is planted and established through the
 construction process so the maintenance actions are not required unless
 noxious weeds or hazardous trees become an issue.

3.7.2. Locations

 All wetland mitigation sites under maintenance responsibility within NW Region, Area 4 are listed by the nearest route and milepost in Appendix F.

3.8. Protected Terrestrial Species

3.8.1. Guidelines

 WSDOT is currently working with the Department of Fish and Wildlife to identify highway locations where known populations of federally listed threatened and endangered terrestrial species exist on or near the highway right of way. These locations are then being matched against maintenance activities with potential to have adverse impacts on the protected species so that necessary maintenance activities can timed to avoid impacts wherever possible.

 Methods and timing of roadside maintenance activities to avoid impacts on protected terrestrial species are described in the NW Region Highway Maintenance Environmental Compliance Guide for Protected Terrestrial Species (due out Spring 2007).

3.8.2. Locations

 Once locations and guidelines have been finalized in the region compliance guide, locations and descriptions of limitations on vegetation maintenance activities will be added to the table in **Appendix F**.

3.9. Railroad Crossings

3.9.1. Guidelines

- State law requires that all trees and brush be kept clear on highway rights of way within 100' of railroad crossings.
- To maximize safety at rail crossings, trees and brush should be cleared as far back as practical to maximize site distance.

3.9.2. Locations

 Locations of all railroad crossing in NW Region, Area 4 are included in the table in Appendix F.

3.10. IVM Treatment Sites

3.10.1. Guidelines

- As discussed in Section 2.1, selected sites are designated for planning, carrying out and monitoring multi-year IVM treatments for control of weeds or other unwanted vegetation.
- IVM treatment sites are documented with an initial record in the IVM
 Treatment Database, to identify the problem to be addressed,
 location(s), management goals, and integrated treatment plan.
- Records are updated each time a treatment is made, results observed, or when the treatment plan is modified based on observations.

3.10.2. Locations

All designated IVM treatment sites within NW Region, Area 4 are listed by the route and milepost in **Appendix F**. This list is updated annually as new sites may be added and successfully treated sites removed.

Zone 1 Maintenance - Bareground Treatment

	OPTION 1	OPTION 2	OPTION 3	OPTION 4
TREATMENT TYPE:	Gravel shoulder	Gravel shoulder	Gravel shoulder	Gravel shoulder

MANAGEMENT GOALS:	Control and eradicate if county requires.	Minimize populations and prevent further spead of weed.	
METHOD:	Foliar treatment w/ herbicide	Mechanical control with follow-up cut stump treatment.	
EQUIPMENT:	Truck mounted sprayer where possible, backpack spayer where necessary.	Mower or hand labor, backpack spayer or spray bottle where necessary.	
MATERIALS:	Krenite 1.5-6 gallons/acre	Crossbow 1.25-1.5 gallons/acre	
TIMING:	In the Fall, after berries drop.	After mowing, in the fall.	
IVM FOLLOW-UP:	Reapply as necessary. Seed and fertilize or plant to restore native plant community	Re-cut/treat as necessary. Seed and fertilize or plant to restore native community.	
REMARKS:			

Appendix B Herbicide Guidelines

Herbicides Approved for Use on WSDOT Rights of Way

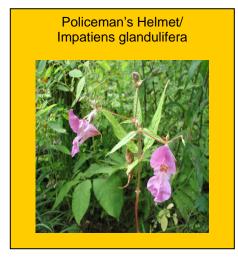

- When making herbicide applications:
 1. Always read and follow product labels
- 2. Always use personal protective equipment when mixing, loading, and applying

Chemical Name	Product Name(s)	Where Used	How/Why Used	Notes/Recommendations	Restrictions	Cautions
2,4-D	Weedar 64 Amine 4 Veteran 720		Selective broadleaf treatment	Ester and acid formulations of 2,4-D may provide a good alternative to amine	Amine formulations of 2,4-D are restricted for use within 60' of all water	Amine formulations cause irreversible eye damage and are highly toxic to rainbow trout.
	Curtail WeedDestroy Platoon Crossbow Escalade Weedmaster Solution Savage Weedone LV4	2 and 3		formulations. A number of the 2,4-D products come premixed with other herbicides.		All 2,4-D products pose risks when applied near grapes and other sensitive crops.
Bromacil	Krovar 1 DF Hyvar		Nonselective pre- emergent grass and weed control	Krovar and Hyvar are premixed with diuron	Westside - Restricted for use Eastside - Krovar restricted for use within 60' of all water	Bromacil is potentially mobile in soil, use caution if rain is possible.
Bromoxynil	Buctril 2EC BroClean Brox 2E		Selective broadleaf treatment	Effective broadleaf weed control without grass seed suppression	Westside - Restricted for use Eastside - Restricted for use within 60' of all water	Highly toxic to fresh water fish
Chlorsulfuron	Telar XP Landmark XP		Selective broadleaf treatment	Product highly effective on Canadian thistle and horsetail. Landmark is premixed with Oust.	None	None
Clopyralid	Transline Curtail Pathfinder		Selective broadleaf treatment	Curtail is premixed with 2,4-D, Pathfinder is premixed with triclopyr	Curtail and Pathfinder are restricted for use within 60' of all water because of mixture with other restricted herbicides.	Curtail contains 2,4-D amine which causes irreversible eye damage and is highly toxic to rainbow trout
Dicamba	Vanquish Veteran 720	weed control, and tree and brush control, Zones 2 and 3	Selective broadleaf treatment	Vanquish is the dicamba formulation without 2,4-D	Veteran 720 is restricted for use within 60' of all water because of 2,4-D amine content	Veteran 720 contains 2-4-D amine which causes irreversible eye damage and is highly toxic to rainbow trout
Dichlobenil	Norosac 4G Casoron	beds	Pre-emergent weed control in ground cover beds. Post emergent control of grasses.	Highly effective for pre- emergent control of unwanted weeds in ornamentals	Restricted for use within 60' of all water	Dichlobenil is highly toxic to aquatic insects
Diflufenzopyr	Overdrive	weed control, Zones 2 and 3	Selective broadleaf treatment	None	None Mastrida Dastrida (facular	None
Diuron	Karmex Diuron 4 L Diuron 80 DF		Nonselective pre- emergent grass and weed control	Cost effective weed control for Zone 1 in Eastern Washington	Westside - Restricted for use Eastside - Restricted for use within 60' of all water	Highly toxic to fish.
Flumioxazin	Payload		Nonselective pre- emergent grass and weed control	Second year of use in zone 1, still evaluating	Restricted for use within 60' of all salt water	Highly toxic to estuarine invertebrates
Fluroxypyr	Vista	weed control, Zones 2 and 3	Selective broadleaf treatment	None	None	Highly toxic to Eastern Oyster, high surface runoff potential
Fosamine	Krenite S	Tree and brush control in Zones 2 & 3	Selective broadleaf treatment	Effective broadleaf tree control without visual impacts	None	None
Glyphosate	Roundup Pro Razor Pro Buccaneer Aquaneat Rodeo Aquamaster	1 1 1 7	Nonselective control of all vegetation	Rodeo, Aquamaster and Aquaneat are approved for use in or over water. Aquatic versions of glyphosate products are approved for use with NPDES permit.	None	None
Imazapyr	Arsenal Habitat	Zone 1	Pre and post-emergent non-selective control of all vegetation	Habitat is an aquatic version of Arsenal - good alternative to glyphosate in certain cases	None	High surface runoff potential, potentially mobile in soil if rain is possible.
Isoxaben	Gallery 75DF		Pre-emergent weed control in ground cover beds	Works well by itself or with Ronstar	Restricted for use within 60' of all water	High surface runoff potential
Metsulfuron- methyl	Escort XP Metsulfuron Methyl 60 DF	Noxious and nuisance weed control, and tree and brush control, Zones 2 and 3	Selective broadleaf and conifer treatment	None	None	None
Norflurazon	Predict	Zone 1	Pre-emergent Weed control in Zone 1 and ground cover beds	Good Zone 1 product but may be difficult to keep in suspension	Restricted for use within 60' of all water	High surface runoff potential
Oryzalin	Oryzalin A.S. Surflan A.S	Ornamental planting beds	Pre-emergent Weed control in Zone 1 and ground cover beds	Product requires additional rinsing to thoroughly remove residues from empty container	all water	Highly toxic to fish
Oxadiazon	Ronstar G Ronstar WSP		Pre-emergent weed control in ground cover beds	Works well by itself or with Gallery	Restricted for use within 60' of all water, gardens, plants bearing edible fruit	Highly toxic to fish
Pendimethalin			Nonselective Pre- emergent grass and weed control	None	Westside - Restricted for use Eastside - Restricted for use within 60' of all water	Highly toxic to fish, high potential for loss on eroded soil
Picloram	Tordon		Selective broadleaf treatment	Highly effective for conifer and broadleaf weed control in Eastern Washington	Westside - Restricted for use Eastside - Restricted for use within 60' of all water	Highly mobile in soil and readily adsorbed through roots of desirable trees
Pyraflufen	Edict	Noxious and nuisance weed control, Zones 2 and 3	2,-4-D substitute, effective on Kochia, Russian thistle	Effective with Roundup for Kochia control	Restricted for use within 60' of all water	Irreversible eye damage, highly toxic to Rainbow Trout
Sulfentrazone	Portfolio		Nonselective pre- emergent grass and weed control	New product available for use in 2006	Westside - Restricted for use Eastside - Restricted for use within 60' of all water	High surface runoff potential, potentially mobile in soil if rain is possible.
Sulfometuron- methyl	Oust Landmark XP	Zone 1	Nonselective pre/post emergent grass and weed control	Landmark is premixed with Telar	None	None
Tebuthiuron	Spike 80DF		Nonselective pre- emergent grass and weed control	None	Westside - Restricted for use Eastside - Restricted for use within 60' of all water	High surface runoff potential, potentially mobile in soil if rain is possible.
Triclopyr Amine	Garlon 3A	weed control, and tree and brush control, Zones 2 and 3	Selective broadleaf treatment	None	None	Irreversible eye damage
Triclopyr Ester	Garlon 4 Crossbow Pathfinder		Selective broadleaf treatment	Works well for invert applications. Crossbow is premixed with 2,4-D, Pathfinder with clopyralid	Restricted for use within 60' of all water	Highly toxic to fish
